

How to create dialogfragment in android

Continue

How to use dialogfragment in android. How to create custom dialogfragment in android.

ReadDiscussionHelp improve the article Article save dialogs are a way to display more concise information or access options without having to create a new activity for the user. This is very useful when we need to show the user more options and things and we don't want to create a whole new screen for that, we want the user to stay on the same screen and we want to show him a floating dialog on the previous screen. Next, let's behave according to the option selected in the dialog box. In almost every good application you will see the perfect use of Dialog Box. In terms of user experience, DialogFragment is also a very good class of Android development tools. In this article, we will learn about the introduction, important methods and implementation of DialogFragment in a real application. What is a DialogFragment? at the top of the activity window in the Android app. This feature was added in API level 11 and deprecated in API level 28. It has its own lifecycle, which makes this class very useful for creating dialogs. Here is an example video to understand what we are going to create in this article and what a dialog fragment actually is - at -15.41.00.mp4 The following are the DialogFragment flow control methods. Using these methods appropriately, dialogs can be effectively controlled. for Android. We're creating a new project, if you're already working on an old project and want to implement a dialog fragment in this project, you can do that. Step 1: Start a new project Android Studio First, launch Android Studio from the Android Studio main screenReadDiscussImprove this article Save article dialog boxes are a way to present more concise information or accessibility options without having to create a new user action. This is very useful when we need to show the user more options and such and so we don't want to create a whole new screen, we want the user to stay on the same screen and we want to show him a popup dialog, to the previous screen. Next, we want to act according to the option selected in the dialog box. In almost every good application, you will see the perfect use of the dialog box. In terms of user experience, DialogFragment is also a very good class of Android development tools. In this article, we will learn about DialogFragment introduction, important methods and implementation in real applications. What is Dialog Fragment? DialogFragment is an Android development tools class used to display a dialog box. at the top of the activity window in an android app. This feature was added in API level 11 and deprecated in API level 28. It has its own life cycle, which makes this class very useful for creating a dialog box. Here is an example video to understand what we will be doing in this article and what a dialog snippet actually is - at -15.41.00.mp4 The following DialogFragment flow control methods use these methods to manage dialogs efficiently. We will create a new project, if you are already working on an old project and want to add a dialog snippet to it, you can do that too. Step 1: Start a new android studio project. First launch android studio from android home screen. studio, you willAn option called Create a new project. Enter the name of the project and fill in all other fields and click "Next". Also, select an empty activity and click "Finish". Now we need to make some application-level changes to the Gradle file. To do this, go to Gradle Scripts > Build.gradle(Module:app) and import the following dependencies and click Sync now.implementation' com.android.support:design:28.0.0'3. action. Working with the activity_main.xml file - The next step we need to do is create a UI for the activity_main.xml file, to do this go to app->res->Layout->activity_main.xml and add Then enter the following XML code. Android ia out->Step 4: UI Design n DialogFragment The next step is to complete the design of the DialogFragment, go to res > Layout > right click go to > New > Layout Resource File and name it as dialog_fragment.xml. Use this code - Now create a SimpleDialog class (right click on root > New > Data Kotlin and/class) and alsofragment simple_dialog.xml layout file. Below is the fragment_simple_dialog.xml code: We have a title, a subtitle and two buttons (for upvotes and downvotes). Paste the following code into the SimpleDialog.kt file: class SimpleDialog : DialogFragment() { Companion Object { const val TAG = "SimpleDialog" private const val KEY_TITLE = "KEY_TITLE" private const val KEY_SUBTITLE = "KEY_SUBTITLE" fun newInstance(title: String, subtitle: String): SimpleDialog { val args = Bundle() args.putString(KEY_TITLE, title) args.putString(KEY_SUBTITLE, subtitle) val fragment = SimpleDialog() fragment.argument = args return fragment } } override fun onCreateView(inflater: LayoutInflater, container: ViewGroup?, savedInstanceState: Bundle?): View? { return inflater.inflate(R.layout.fragment_simple_dialog, container, false) } override fun onViewCreated(view: View, savedInstanceState: Bundle?) { super.onViewCreated(view, savedInstanceState) setupView(view) setupClickListeners(view) } override fun onStart() { dialog super.onStart() }.window?.setLayout(WindowManager.LayoutParams.MATCH_PARENT, WindowManager.LayoutParams.WRAP_CONTENT) private fun setView(view: View) { view.tvTitle.text = argument?.getString(KEY_TITLE) view.tvSubTitle.text = arguments?.getString(KEY_SUBTITLE) } private fun setClickListeners(view: View) { view.btnPositive.setOnClickListener { // TASKS: close the task here() } view.btnNegative.setOnClickListener { // Here is the description of the above code: The newInstance() method is used to get the title and subtitle from the activity. The onCreateView() method is responsible for creating the dialog fragment. in onCreateViewCreated() we perform the tasks to be performed after the dialog is created. For example, remove the title and subtitle and put them in a SimpleDialog text view. setupView() is a custom function that helps set up text in SimpleDialog. setupClickListener() is another custom function that helps setup all clicks from SimpleDialog. After clicking the positive/negative button, the dialog box is closed with the dismiss() method. You can change it according to your use case. Now from MainActivity you should open a dialog by clicking the button. Below is the code for the same: btnSimpleDialog.setOnClickListener { SimpleDialog.newInstance(getString(R.string.label_logout), getString(R.string.msg_logout)).show(supportFragmentManager, SimpleDialog.TAG) } Here I am passing the title and subtitle from activities. Now run the application and click the button to open a dialog box. If you want to use the Android-provided AlertDialog instead of your own dialog, all you have to do is override the onCreateDialog method and create your own AlertDialog there. In this case, you don't need to override the onCreateView method. So the SimpleDialog.kt file would have the following code: override fun onCreateDialog(savedInstanceState: Bundle?): Dialog { val builder = AlertDialog.Builder(activity) builder.setTitle("Alert Dialog") builder.setMessage("Hello! I'm a notification dialog") builder.setPositiveButton("Cool", object: DialogInterface.OnClickListener { override fun onClick(dialog: DialogInterface, which: Int) { dismiss() } }) builder.setNegativeButton("Cancel", object: DialogInterface.OnClickListener { override fun onClick(dialog: DialogInterface, which: Int) { reject() } }) return builder.create() } } In this example, the DialogFragment will contain a single EditText and a button. When the button is clicked, the text EditText is displayed in the main activity. For this we will use SharedViewModel concept. If you are not familiar with SharedViewModel, you can read our blog about it. NOTE: Don't forget to add LiveData and View-Model dependency. Let's start with MainActivity. In the activity_main.xml file we need to add one button and one textview to display the title. So the final code for the activity_main.xml file would be: < android.support.design.widget.AppCompatButton android:id="@+id/btnSimpleDialog" android:layout_width="wrap_content" android:layout_height="@dimen/dimen_48" android:layout_margin="@dimen/dimen_12" text="@string/label_simple_dialog" app:layout_constraintBottom_toTopOf="@+id/btnDataDialog" app:layout_constraintEnd_toEndOf="parent" app:layout_constraintStart_toStartOf="parent" /> Now create a DialogWithData and SharedViewModel class. Below is the code SharedViewModel.kt: class SharedViewModel : ViewModel() { val name = MutableLiveData() fun setName(text: String) { name.value = text } } When a button is clicked in the dialog, setName() is called with the text EditText and the name is respected as MainActivity. Below is the codeDialogWithData.kt file: class DialogWithData: DialogFragment() { Companion object { const val TAG = "DialogWithData" } private lateinit var viewModel: SharedViewModel override fun onCreateView(inflater: LayoutInflater, container: ViewGroup?, savedInstanceState: Bundle?): State? { return inflater.inflate(R.layout.fragment_dialog_with_data, container, false) } Replace Fun onCreateView(view: View, savedInstanceState: Bundle?) { super.onViewCreated(view, savedInstanceState) viewModel = ViewModelProvider(requireActivity()).get(SharedViewModel::class.java) setupClickListeners(view) } replace fun onStart() { super.onStart() } dialog?.window?.setLayout(WindowManager.LayoutParams.MATCH_PARENT, WindowManager.LayoutParams.WRAP_CONTENT) } private fun viewClickListeners(view: View) { view.btnSubmit.setOnClickListener { viewModel.setName(viewModel.name.text.toString()) } } } When the submit button is clicked, the SharedViewModel's setName() method is called. The name must be respected in MainActivity and we also need to implement button click listeners to open the DialogWithData fragment. So the final MainActivity code looks like this: class MainActivity : AppCompatActivity() { private lateinit var sharedViewModel: SharedViewModel override fun onCreate(savedInstanceState: Bundle?) { super.onCreate(savedInstanceState) setContentView(R.layout.activity_main) sharedViewModel(this).get(SharedViewModel::class.java) sharedViewModel.name.observe(this, Observer { tvName.text = it }) btnSimpleDialog.setOnClickListener { SimpleDialog.newInstance(getString(R.string.label_logout), getString(R.string.msg_logout)).show(supportFragmentManager, SimpleDialog.TAG) } btnDataDialog.setOnClickListener { DialogWithData().show(supportFragmentManager, DialogWithData.TAG) } } } Now you can run the application and enter data into the EditText window and display the text in the MainActivity. This allows you to share DialogFragment data with the Activity. For further refinement, you can check if the EditText value is null or not. If it's null you can display a toast error, if not you can just update the TextView. This is all about DialogFragments. If you want to see the entire source code, you can visit it here. In this blog we learned how to implement DialogFragment in your Android application. We have seen that traditional warning dialog boxes are no longer recommended. So we need to use DialogFragment to implement dialog boxes. We created a sample DialogFragment to understand this clearly. That's it for this blog. Keep learning :) MindOrks team! MindOrk!
