Caliburn a 2

Tips for new nicotine users: Sub-ohm or low resistance atomizers produce a higher throat hit than standard,high resistance atomizers. We strongly suggest 3 to 6mg eLiquid or lower with sub-ohm or low resistance atomizer heads. Preference may vary depending on the user and frequency of use. For standard,high resistance atomizers or restrictive devices (ex. pod based,pen), we recommend 6mg or higher due to the mouth to lung (MTL) design of this atomizer,tank. Preference may vary depending on the user and frequency of use. Warning: Sub ohm or low resistance tanks should only be used by experienced users. Extra safety precautions should be practiced when using a sub ohm tank. This tank will only work on a mechanical mod or a regulated mod capable of firing sub ohm atomizers and coils. For example, if you have a 0.2ohm coil, your mod must be able to fire atomizers of 0.2ohm or lower. You must also ensure that your batteries can handle sub ohm atomizers and coils. If you're using a regulated mod, make sure it can handle the amps. Improper use can lead to injury or damage. For mechanical mod users, please use 20 Amp batteries or higher. Use the OHMS LAW CALCULATOR, CHECK YOUR AMPS, and be safe! Any questions please contact us by email. Battery Safety Warning: Use special caution when using Li-Ion cells, they are very sensitive to charging characteristics and may explode or burn if mishandled. Make sure you have enough knowledge of Li-Ion rechargeable batteries in charging, discharging and assembly before use. Do not let your batteries come into contact with metal objects such as keys, loose change or any other metal objects. Doing so will put you at risk for short circuiting your battery and explosion. Do not put loose batteries in your pocket, purse, bag or anywhere else. When the battery is not in use, you must store it in a plastic battery case to reduce the risk of a battery explosion. Always charge in or on a fire-proof surface. Never leave charging batteries unattended. Do not modify batteries or chargers in any shape or form. Only use Lithium Ion rechargeable batteries in devices that have a built in protection circuit board(PCB) that detect shorts, over-discharge, over-charging etc. Use of lithium ion batteries without a PCB may increase your risk or explosion and/or fire. Store your batteries away from the sun and heat to prevent overheating your batteries. Please be sure to inspect your battery before use to ensure it is not damaged including tears or rips in the battery wrap. Discontinue use immediately if battery is damaged. Do not discharge batteries below 2.5V. Do not charge the batteries over 4.2V. myvaporstore.com will not be held responsible or liable for any injury, damage, or defect, permanent or temporary that may be caused by the improper use of a Li-Ion battery. Please have a basic understanding of the batteries you are using and how to care for them properly. The Caliburn A2 is the latest pod system by Uwell, and the follow-up to the original Caliburn, one of the most popular vapes ever. In fact, it's the third Caliburn, as Uwell released the G last year—which is a part of another Caliburn sub-line, but more on that later on.So, here's what to expect from the A2. It is a beginner-friendly pod system that takes replaceable pods holding up to 2 mL of juice and housing a built-in, newly designed 0.9-ohm coil. It is both draw and button activated, features a 520 mAh battery, and charges through Type-C though it's not included with the kit.I was never a huge fan of the original, as I was never sure of what it was supposed to be when it comes to the draw. I ended up using it as an RDL vape, but I had better options in this category. But I really liked the G which I reviewed some time ago, so let's see how the A2 fares against previous Caliburns and if it's worthy of your attention.Price: \$24.99 (at MyVpro/Colors: Black, grey, green, blue, orange, iris purple.Before I dive into the design of the A2, let me offer a quick rundown of the Caliburn lineage. The Caliburn A2 is a direct sequel of the original and part of the A line, while the Caliburn G which came out in 2020 belongs in its own line. The "A" comes from the Greek letter alpha with the line featuring products that are easy to use and more beginner-friendly, while "G" comes from Great/Grand, with products that are more customizable and advanced.The A2 is practically identical in size to the original Caliburn, and a little bit smaller than the G. It measures at 110.1 mm x 21.3 mm x 11.7 mm and weighs 33 grams with a full pod on. While not the smallest pod vape around, the overall footprint of the A2 is practical and it goes in and out of the pocket pretty easily.The device comes in six colors, with the standouts being the bright orange one, and the iris purple that was also used in the original Caliburn. From a design perspective, there are two major upgrades over the original; a Type-C charging port and a large window on the front that allows checking juice levels easily. My only minor complaint with the window is that it's only on one side, so you'll need a bit of light to see what's going on inside.The mouthpiece is also redesigned—it is much thinner than the mouthpiece of the G, and similar in shape but smoother than the mouthpiece of the original Caliburn. In fact, "smooth" is a great word to describe this device. Uwell ditched the textured edges and gave the A2 a more modern look and pleasant hand feel.With the A2 being part of the beginner-friendly A line, operating it is as easy as it gets. Uwell kept the practical top fill of the previous Caliburns, so you just have to slightly push the mouthpiece on the flat side to remove it. Then just push the nozzle of your juice bottle in the red marked hole at the top of the pod, and fill the pod up. Put the mouthpiece back on, set the device aside for five minutes, and you're good to go.Five clicks turn the device on and off, and with the A2 being both button and draw-activated, you can choose if you want to push the button for a warmer vape, or just inhale on the mouthpiece. The coils are built in the pod and new pods come with their own mouthpiece, so you can dispose the mouthpiece in the recycle bin and the rest of the pod in the trash when it starts to taste funny—or proactively when a week passes.The pods of the A2 are redesigned, and as a result, this device is not compatible with the pods of the original or the G. There's only one pod option, and it comes with 0.9-ohm coils, featuring what Uwell calls Pro-Focs tech. There's not much info about this tech on their site, outside of the fact that it focuses on flavor. And it delivers.The flavor I am getting from the A2 is clean and crisp, and not far from what I've been getting from the Innokin Zlide. Pods have gone a long way in the last couple of years, and the A2 is up there with the best of them as far as flavor goes. And that's especially true with 50/50 juices, even though the device could easily handle the 75VG juice I tried it with.As for coil life, I started getting bit of juice in the mouth after the sixth or seventh refill, but flavor was not impacted yet. Around the tenth or eleventh refill the coil started giving up and I had to replace it. That's more than 20 mL of juice, which is not bad at all for a device that takes built-in coils.One thing I have to note is that the sensor on the A2 sometimes feels like it wants me to add a tiny bit of lung action in there. In fact, in auto-draw mode it feels only a bit tighter than the airy MTL/tight RDL vape I was getting from the original. But when vaping using the button, it is a comfortable and warm MTL with a defined throat hit. Both my 20 mg salts and my 9 mg regular nic juice shined in button mode. The draw is not super tight, but I really feel it's at or close to the sweet spot for the majority of MTL vapers. I ended up pressing the button most of the time, but I really liked the fact that the two experiences were slightly different, and I did sometimes use the sensor when I wanted a cooler and looser hit.Back when I reviewed the Caliburn G, I was very happy with the performance of the coils and didn't have major leaking issues—although from what I've seen online, others didn't have such a positive experience. But on the A2, the contacts are bone dry even when left unused for days. Props to Uwell for nailing their anti-leaking design, and I really hope the pods remain consistent between batches.Battery life and chargingThe Caliburn A2 charges through a Type-C port that's positioned at the bottom of the device. I timed a full charge at 52 minutes, but note that Uwell claims that it can reach a 90% charge in 35 minutes.As for battery life, expect to go through approximately one and a half pod on a charge. That's around 3 mL, which is more or less the industry standard for compact vapes—if not slightly more.Finally, there is an LED light close to the bottom of the front of the device, and it serves as battery indication.Green: 60-100%Blue: 30-60%Red: 0-30%ProsCompact and lightweight Very easy to use Great hand feel Juice window is a nice update Easy top fill Button and draw activated Coils last for around 20 mL Great flavor Satisfying MTL when using the button No leaking/condensation Good battery life (around 3 mL on a charge) Fast charging through Type-C (52 minutes)ConsJuice window only visible on one side Only one coil option A bit of juice in the mouth after 5-6 refills Type-C charge cord not includedWhile the Caliburn A2 does not bring anything particularly new to the table, it's a solid vape. It did catch me off guard with its airflow, because I was expecting Uwell to stick to this midway MTL-RDL airflow that people seemed to love on the original Caliburn. And while they kinda did—since in auto-draw mode it vapes a lot like the OG—using it with a button offers some of the most flavorful and warm MTL action I've had on a pod vape.If the original was a bit too airy for your type of MTL, the A2 may be exactly what you've been looking for. And if you are a beginner vaper, or just a vaper in the market for a dependable pod system, the A2 deserves consideration. It is practically a leakproof pod system, with solid coils, and a simple but elegant design.Are you a fan of the original Caliburn? What do you think of the A2? Let me know in the comments. The Caliburn A2 is the latest pod system by Uwell, and the follow-up to the original Caliburn, one of the most popular vapes ever. In fact, it's the third Caliburn, as Uwell released the G last year—which is a part of another Caliburn sub-line, but more on that later on.So, here's what to expect from the A2. It is practically a leakproof pod system, with solid coils, and a simple but elegant design.Are you a fan of the original Caliburn? What do you think of the A2? Let me know in the comments. UWELL's exclusive flavor adjusting technology brings you authentic flavor to the greatest extent. Published 22 August 2022, Updated 10 April 2024Over the years, UWELL has slowly become one of the top brands you can find in the vaping industry, and this is due to the release of its extremely convenient and reliable devices. Since they released the original Caliburn pod system, which is still a best-selling pod vape device on the market, they have become more and more popular and continue to grow and dominate the pod system market.The release of the original Caliburn several years ago, UWELL has continued to release more pod kits in the Caliburn range, such as the Caliburn KOKO and the Caliburn G pod systems, and they have now released their latest product entitled the UWELL Caliburn A2 pod device.Since the release of the UWELL Caliburn A2 pod kit, they have become a top-rated product thanks to their reliability, ease of use, and hassle-free approach to vaping.In this article, we shall go in depth about the UWELL Caliburn A2 and its specs and features.What To Expect From The Caliburn A2?Whether you are new to vaping or an experienced vaper, the Caliburn A2 will be an ideal vape kit for anyone trying to switch from smoking traditional cigarettes to vaping or someone who already uses a vape but would like something smaller and discreet.You can expect a day's battery life from the Caliburn A2 as well as between 7-14 days' worth of use from the pod.Caliburn A2 Pod System Performance.The UWELL Caliburn A2 houses a 520mAh battery and will deliver a fixed output wattage of 15 watts which is enough battery life to last roughly a full day depending on how frequently you vape. The power output of 15 watts is also more than capable enough to give you a significant amount of cloud production and a full, flavourful vaping experience.As it currently stands, only one pod can be used inside the UWELL Caliburn A2, which is the Caliburn A2 0.9 ohm meshed - FocAl H UN2 pod. The UWELL Caliburn A2 pods are suitable for almost all types of juice, but it has been found to perform best using nicotine salt e-liquids or juices containing 50% Vegetable Glycerin and 50% Propylene Glycol.It is also essential to remember that juices with a high VG ratio can potentially burn out the pod at a much faster rate, resulting in you needing to replace the entire pod much faster than if you were to use a higher PG-based liquid.The Caliburn A2 features an auto-draw activation system that does not require you to press the fire button to begin vaping; inhale, and the vapour will be produced. However, you can still use the fire button to activate the vape, just like most traditional vape kits.The Caliburn A2 also features a USB type C port on the base of the device that can be used for fast charging when using it in unison with a 1A charger. It is possible to go from 0% to 90% within 30-40 minutes when using the fast-charging cable correctly, which is also a key reason why the Caliburn A2 has become so popular amongst vapers.Caliburn A2 Pod System Performance Recap.Max wattage output - 15W,0.9 ohm meshed - H UN2 pod,USB type C charging port.Auto-draw activation.Caliburn A2 Design & Appearance.The UWELL Caliburn A2 is a small, thin, almost pen-shaped device that can easily fit in the palm of your hand and is surprisingly light in weight, weighing a minor 33 grams, similar in weight to most of the disposable vapes on the market today.Dimensions: 110mm X 21mm X 11 mmWeight: 33 gramsBattery size: 520 mAhDisplay: LED indicatorCaliburn A2 Battery & Body.The Caliburn A2 refillable pod system houses a very similar design to that of the original Caliburn, other than the fact that the Caliburn A2 has a much more smooth and sleek design with its rounded edges compared to the sharper, block-like edged finish that is on the original Caliburn.The Caliburn A2 is a small, almost pen-shaped device that can easily fit in the palm of a user's hand. Due to its small size, it is straightforward to store the Caliburn A2 in a pocket, a bag, or even a purse.The Caliburn A2 is very comfortable to hold. This device is available in 8 different colours: Black, Blue, Green, Grey, Iris Purple, Orange, Aqua Blue, and Black/Gold.The front of the Caliburn A2 has a small and round fire button; this allows for manual vaping when pressed. What's also great about the Caliburn A2 is that it also features an auto-inhale activation system, meaning you can produce vapour by just inhaling on the device without pressing the fire button.The LED battery light indicator, which lights up when both are inhaling and charging, sits at the bottom of the device, underneath the fire button and Caliburn logo.LED Light Indicators.The Caliburn A2 will have 3 different colour indications on the LED light indicating the battery percentage (Green, Blue, and Red). These coloured LED indicators are also used to warn you of issues such as no atomizer and short circuits.Battery indicator: Red = 0-30%, Blue = 30-60%, Green = 60-100%Whilst charging: Red flash = 0/30%, Blue flash = 30-60%, Green flash = 60-90%, Green static = 100%LED Light Protection.Low battery - LED will flash red 10 times and will not fire.Short circuit - LED will flash red 3 times.No atomizer - LED will flash blue 3 times.Overtime - LED will flash green 5 times if inhaled for longer than 8 seconds.Caliburn A2 Pod.The pod housed in the Caliburn A2 is a 2ml pod including a built-in 0.9 meshed - H UN2 coil inside. The Caliburn A2 pods have a very similar design to the original Caliburn pods other than a slightly smoother design with rounded edges. The A2 pods also feature an e-liquid window so you can see your quantity of vape juice without the need to remove the pod or mouthpiece.The mouthpiece of the A2 pods can be removed by pulling it off the pod, revealing the insert holes or the fill port for e-liquid to be added. It is important to avoid filling vape juice in the centre hole as this is the airflow hole.The Caliburn A2 pods are more suited for an MTL style of vaping, but these pods are more than capable of performing like a DTL vape to produce a thicker cloud of vapour.The UWELL Caliburn A2 pods are connected to the top of the battery using a magnetic connection, ensuring that your pod is fully connected before being able to fire up the deviCaliburn A2 Design & Appearance Recap.Dimensions - 110mm X 21mm X 11 mmWeight: 33 gramsBattery Size - 520 mAhMTL vaping/Restricted DTL vapingLightweightLED indicatorManual and auto-drawUSB type C fast chargingWhat's Inside The Box?When you have received a brand new Caliburn A2 pod kit, the box it comes in will contain a Caliburn A2 device/battery, 2x 0.9ohm meshed - H UN2 pods, and a user manual which is everything you will need apart from e-liquid to begin vaping.Unfortunately, the Caliburn A2 does not include a USB type C charging cable.Contents:Caliburn A2 device/batteryPacking box2x 0.9 ohm meshed - H UN2 podsUser ManualCaliburn A2 Pod System Ease Of Use.Over the years, a majority of vaping devices have become much easier to use. Many brands are now trying to take a hassle-free approach to vaping, UWELL being one of them, and the Caliburn A2 is a prime example of them doing an amazing job of this.A beginner or more experienced vaper can enjoy the Caliburn A2 thanks to its convenience and easy functionality.To use the device itself, you press the fire button 5 times to turn the mod on or off, and you can also use this fire button to activate the vape, but this is unnecessary as the A2 features and auto draw activation system.To fill the pods, you just need to remove the mouthpiece by pulling it off the pod, and then this will reveal the side hole that is used to insert the e-liquid, and the pods themselves will need disposing of and replacing when they have burnt out which avoids the hassle of changing coils.To charge the Caliburn A2 device, you must first obtain a USB type C charging cable and then connect the charging cable to a computer/laptop/tv/games console or any similar device, or you can use the USB type C charging cable in a charger plug that is no higher than 1A.Caliburn A2 Pros & Cons.The Caliburn A2 is a great device, but like almost anything, there are pros and cons. We shall now list both the pros and cons of the Caliburn A2 pod system.Pros.CompactLightweightTop FillJuice window to check juice levelFast charging with USB type CDurable buildNo LeakingGreat flavourGood battery lifeCons.USB type C charging cable not includedLimited to one pod/coil optionOccasional spit backThe juice window is only visible on one sideCaliburn A2 Verdict.The UWELL Caliburn A2 is a fantastic little device or starter kit that we think is suited for someone just getting into vaping or someone who would still class themselves as a beginner vaper. However, this device can still be very suitable for a more experienced vaper looking for something small and discreet but still capable of producing a fair amount of cloud and a strong flavour.The pods used in the Caliburn A2 are amazing pods that can last between 7-14 days or more, depending on how frequently you vape and which type of vape juice you use in the pod. The only downside to these pods is that there is only one resistance pod available at this moment (0.9ohm).The vaping experience found with the Caliburn A2 is significantly satisfying as it offers an MTL-style vape but is still capable of producing a thicker cloud to give the user that DTL-style vape sensation.The build quality on the Caliburn A2 is outstanding; with its aluminum alloy body and metallic finish, it's very durable and reliable for everyday usage, but we did find that when using a Caliburn A2 over a long period, the paint can begin to chip off, but this does not affect the performance of the device.For more information on Caliburn kits, check out our articles: UWELL Caliburn G2 Review: Is It The Best Pod Kit and UWELL Caliburn AK2 Vape Review: Better Than KOKO? Royal Mail Tracked 24 Order before 9 pm for same-day dispatch and next-day delivery* Deliveries are made 7 days a week (excluding postcode exceptions* and bank holidays) Tracked service with a 2 hour delivery window Safe place option FREE on orders over £20 £2.99 for orders under £20 *Orders to remote areas listed on Royal Mail's exclusions list may not arrive until a day later.
