All of our worksheets are created by teachers with real life experience creating worksheets for their classrooms, guaranteeing you the best quality possible. Whether you homeschool, teach State or Common Core aligned curriculum, or follow an international syllabus, our worksheets can be used with all standards. All worksheets can be edited to suit your curriculum, student ability level, and age. You'll save hours every single week by using our worksheets in your lesson plans. Perhaps you've just seen a baby rabbit, or even an adult one, and you're wondering what are baby rabbits called? Well, in this article we're going to go through the names of baby rabbits, along with why they're called these baby rabbit names and how they got their names. First, here's the quick answer, and then we'll get into the details...What Are Baby Rabbits Called? Baby rabbits are called "kittens" just like baby cats. This gives rise to other names like "kits" and "kitties". Baby rabbits are also called "Bunnies" unofficially. The word "bunny" is also believed to have come from the word "Coney". Historically, even the word "Rabbits" was also applied to baby rabbits. Baby animals are some of the cutest things you'll ever see, they have such a wide appeal. But it's actually quite often that we refer to these cute creatures using the right name. Sometimes it may even surprise you that some animals do have a different name for their young ones – like rabbits. So to understand more about this, let's dive right in. Read on, or watch the video below from the Ranger Planet Youtube Channel. The standard or commonly accepted "official name" for baby rabbits is "Kittens". This has given rise to other names for baby rabbits like "Kits" or "Kitty". But one of the most common names that we use globally for baby rabbits is "bunnies" or "bunny". While names like "kitty" and anything that starts with Kit come as a corrupted form of the original name for baby rabbits "kittens", the bunny has quite an interesting history to it. If you have a new baby rabbit, then check out my list of 100 rabbit names and their meanings. Bunny is a famous name used for baby rabbits, mostly used by children. This is the most common and informal name baby rabbits are referred to. But regarding the origin of the word bunny... bunny was, in the past used to describe a young girl (rightly or wrongly!). Over time though, it was adapted to refer to young, cute and small animals like rabbits, and now baby rabbits completely own this name. The word bunny also has another history ...back in the 18th century. Where the common words used to name rabbits – be it from adults to baby rabbits – were "Coney". The name "coney" was mispronounced as "cunny". This mispronunciation, along with the rise of a word that sounds similar to "Coney", which was popularly used for vulgarity meant people avoided using the word coney to refer to rabbits. Eventually, people tried different rhyming and alternative names and finally "coney" turned to "bunny". But during this time "bunny" was in general used to name both baby and adult rabbits. Whereas now it's used mainly for referring to baby rabbits. As another surprise, some also say the word "Rabbit" in fact was used to call "baby rabbits" for "young hares" and not adult rabbits. Somehow along the way, these words have been known to switch and now "rabbits" are the common terms for this animal, be it for adults or young ones. Baby rabbits are famously called "bunny". A rabbit remains a baby until it grows to around 9 months, after which it becomes an adult. Rabbits remain adults until 4-5 years of age, and when they grow older they become ...elderly rabbits ... of course! On average rabbits live up to 10-12 years of age. When taking the names for rabbits in general for referring to males and females, the females are called "does" and males are called "bucks". Whereas when taking parent rabbits, the mother rabbit is called "The Dam" and the father rabbit is called "The Sire". Pick your next baby rabbit name based on the meaning of the name. If you're considering keeping Rabbits as pets, then here are a couple of resources from Amazon that will help you in understanding more about how to raise Rabbits to enjoy them as Pets or to immerse yourself in Rabbit culture even more. The Everything Pet Rabbit handbook's said to be good luck to carry a Rabbit's foot as a symbol. Here's the one we've selected from Amazon, we hope it brings you good fortune! Real Rabbit Fur Rabbits Foot Keychain Bunnies are just so cute! Here's a video outlining the content of the article. We hope this has helped you to know what to call a rabbit and certainly for baby rabbits at the right time in their lives and the right gender. Rabbits' names have changed quite a bit throughout history, but I think we're safe to use the name for baby rabbits as "bunny" or plural "Bunnies" for a long time to come. This content has been checked and verified by a qualified veterinary practitioner. Rabbits are both popular pets and very complex creatures that require specialist care and a knowledgeable owner. It is certainly fair to say that even for experienced keepers, there is always something new to learn! If you think you're a rabbit expert, test out your knowledge by seeing how many of the following forty interesting facts about rabbits you were not already aware of! A female rabbit is called a doe, which is where we got the phrase "doe eyed" from, referring to the large, soulful bunny eyes! A male rabbit is called a buck. Baby rabbits are called kits, but not kittens! Rabbits belong to a species grouping known as the lagomorphs, although they are often wrongly classified as rodents, particularly in the wild! The teeth of the rabbit never stop growing throughout their lives, but are worn down by the process of chewing their food. The phrase "long in the tooth" comes from rabbits, as elderly rabbits tend to have longer teeth as their metabolisms slow down. There are over fifty different species of rabbits recognised worldwide. Rabbits can be trained to go to the toilet in a litter box relatively easily, as rabbits are clean animals that naturally stick to the same areas each time to do their business. Domestic pet rabbits can live up to around ten years old, although seven or eight is more usual for a well cared for rabbit. The weight of adult rabbits can vary considerably depending on their breed, with tiny dwarfs weighing around 2lb, and some giant breeds tipping the scale at around 50lb! Baby rabbits begin the process of being weaned from their doe at the age of around eight weeks. Baby rabbits are born without any fur, and need to cuddle up together to keep warm! Like puppies and kittens, baby rabbits are born with their eyes closed, and the eyes do not begin to open until around the age of two weeks old. Rabbits can and sometimes do purr to indicate their satisfaction with things, much in the same way that cats do! Even very small rabbits can jump up to around three feet high when they are really trying! Rabbits are very susceptible to the effects of changes in temperature, and can easily become prone to heatstroke in hot weather. Rabbits' eyes are on the sides of the head, giving them excellent vision all the way around, with a small blind spot at the point directly in front of them and directly behind them. As prey animals, this trait enables them to keep a lookout for predators. Excited rabbits will soon show their excitement by jumping and twisting around in mid air, and generally being full of the joys of spring! Juvenile rabbits can mate and begin to breed from the age of just three months, so spaying and neutering your pet rabbits is very important. When a doe is pregnant, she will use her teeth to pluck out some of her own fur to line the nest for her coming babies. Rabbits can also suffer from false or phantom pregnancies, causing them to display nesting behaviour even when they are not pregnant. Shock and sudden frights can literally scare a rabbit to death, as they have small, delicate hearts that beat at a very fast rate. Baby rabbits still with the doe are referred to as a litter, the same as kittens and puppies are. The time between conception and birth in the rabbit is just one month, one of the many reasons why rabbits are such prolific breeders! Rabbits are physically unable to vomit. Rabbits need to consume a large amount of hay or grass each day, in order to keep their digestive system moving and to bind hairballs in the stomach and allow them to pass. A group of rabbits together is collectively referred to as a herd. In the wild, the underground burrows that provide rabbits with their homes are known as a warren. When a doe has a litter, she leaves them alone for the greater part of the day from the time that they are newborn, in order to forage for food and to eat. Typically, she will return to her litter just once a day for a few minutes in order to feed them. Rabbits require a considerable water intake each day, and a rabbit that weighs 2lb will drink as much water in a day as a dog that weighs 10lb! Rabbits love to chew, and need a constant supply of safe, chewable toys to be happy and to keep their teeth in good condition. Rabbits do not hibernate or alter their behaviour considerably during the colder months of the year. Rabbits do not sweat in the same way that people do, but instead have sweat glands in the pads of the feet, which allows them to cool down and maintain their temperature. Rabbits are very fastidious about their grooming habits, and spend considerable amounts of time grooming themselves. Rabbits have 28 teeth in total, all of which grow constantly. Released domestic rabbits are highly unlikely to thrive or survive in the wild. Rabbits eat their own droppings to provide additional nutrients to their diet, and assist with digestion. An annoyed rabbit will growl to let you know that they are displeased! Rabbits can be very territorial animals, and will often defend their home against even their owners if incorrectly socialised! The largest rabbit in the world is a Continental Giant named Ralph, who weighs in at 55lb! The oldest recorded rabbit on record reached sixteen years of age, and died in 2012. Reading Time: 2 minutes Rabbitology is a site where one can find articles about rabbits. It is all about their behavior, eating habits, body language, etc. Rabbitology creates an opportunity to decide if anyone is confused about having a rabbit as a pet. There are many Q&A sites that don't help much and sometimes you are puzzled about finding the right information. Don't worry, Rabbitology is here by your side where you can find accurate answers. Stick with us for more updates and articles about your favorite animal. About the Author Hey there, I am AR Dipro, the author of these articles you visit here. I am having some pet rabbits for more than a year. As it was the first time for me to have a rabbit as a pet, I found many difficulties also I had fun with my bunny. I found many interesting facts about rabbits. There were days when my bunny was sick and sometimes it was behaving unusually. I had to call vet doctors, checking the quora sites, and other answer-question sites related to rabbits. But it took time and sometimes a situation came I couldn't find the right answers for my bunny. From then I was thinking about what if I start writing my own blog site about rabbits and all the other experiences I have met. I shared the idea with my friends and colleagues. They really hit it. I started my journey with an Instagram page. There I found many friends and noticed other rabbits carefully. The articles you find here is kind of a result of my studying and thinking. I tried to find out the most accurate information and took a survey when I was ready to write about an article. Sometimes it takes more time than I guess. So if the updates are late, please don't be hard with me. Consider that your favorite rabbitology is getting a new article with lots of new information. If you have any Questions of Preference feel free to contact with us. Not ready to purchase a subscription? Click to download the free sample version Download sample Rabbits are mammals that belong to the Lagomorph order that also includes hares and pikas (Lagomorph means "hare-shaped"). There are over 45 different breeds of rabbits and one common misconception is that rabbits are rodents because they have incisor teeth that continually grow. Keep reading for more rabbit facts and information. Facts about Rabbits Rabbits are small mammals that belong to the family Leporidae. Until 1912, rabbits and hares were formerly classified in the order Rodentia (rodent). They were then moved into a new order called Lagomorpha, which also includes pikas. There are over 300 breeds of the domestic rabbit and 13 wild rabbit species, among which are seven types of a cottontail rabbit. Rabbits are commonly called bunnies or bunny rabbits There are over 300 breeds of domestic rabbits. Rabbits are a popular choice of pet for many families. They are regarded as highly intelligent, inquisitive animals. Rabbits can be called by other names. An old 18th century word for an adult rabbit is a coney. It is derived from the Dutch word for a rabbit, which is "konijn". An informal name for a rabbit is a bunny, and is most often used by small children. Anatomy and Senses Rabbits have large hind leg bones and strong leg muscles which give them speed and agility as defenses against predators. Rabbits use their strong claws for digging. They will also use their claws and teeth for defense against predators and when fighting with other rabbits. Each front foot has four toes plus a dewclaw. Each hind foot has four toes but no dewclaw. Rabbit's ears are typically long as they are primarily used to detect and avoid predators. Rabbits wiggle their noses often, which not only helps to draw air in to fill the lungs but also helps them to differentiate the tiny trace of chemical molecules or pheromones in the air to detect danger, identify friends, or potential mates. Because rabbits are vulnerable to predators, they have evolved so that their eyes sit wide and high in their skulls. This provides an almost 360-degree field of vision. There is a small blind spot at the bridge of the nose. Rabbit's teeth have open roots that enable them to grow constantly. Diet and Digestion Rabbits are herbivores that feed by grazing on grass and other leafy plants and flowers. Rabbits graze rapidly for roughly the first half-hour of a grazing period, followed by about half an hour of more selective feeding. Their diet contains large amounts of cellulose from plant cells, which is hard to digest. Rabbits solve this problem through a form of hindgut fermentation. They pass two distinct types of feces: hard droppings and soft black viscous pellets which are immediately eaten. Rabbits eat their soft droppings again to digest their food further and extract sufficient nutrients. Hard pellets are made up of hay-like fragments of plant cuticle and stalk, being the final waste product after the redigestion of soft pellets. These are only released outside the burrow and are not eaten again. Because rabbits cannot vomit, if buildup occurs in the intestines (due often to a diet with insufficient fiber), intestinal blockage can occur. Reproduction A female rabbit is called a doe, a male rabbit is called a buck, and baby rabbits are called kits. A female rabbit generally reaches sexual maturity at 3 to 8 months old and can conceive at any time of the year for the duration of her life. A rabbit's gestation period ranges from 28 to 36 days with an average period of 31 days. The size of a single litter can range from four to 12 kits allowing a female to deliver up to 60 new kits a year. After birth, the female can become pregnant again as early as the next day. This is because the act of mating causes the doe to release eggs, which will then be fertilized. Rabbits are typically good mothers and look after their babies well. The babies burrow to the bottom of the nest where they spend a lot of time sleeping unless the doe wakes them up for feeding. Baby rabbits will usually stay with their mother. They will nurse mill for four to eight weeks before weaning onto grass. Rabbit Products and Uses As livestock, rabbits are bred for their meat and fur. The earliest breeds of rabbits were important sources of meat, and so became larger than wild rabbits. Rabbit meat is sweet and lean and is considered one of the ultimate healthy foods as it is low in fat and cholesterol, as well as high in protein. Rabbit fur, prized for its softness, can be found in a broad range of colors and patterns, as well as lengths. The Angora rabbit breed was developed for its long, silky fur, which is often hand-spun into yarn. Other domestic rabbit breeds have been developed primarily for the commercial fur trade. In addition, rabbits are useful for their nitrogen-rich manure and their high-protein milk. Rabbit hides can be crafted into hats, gloves, blankets and bedspreads, toys, pillow covers, baby booties, and more. It's an exceptionally warm garment lining for people who spend long periods in intense cold, such as hunters, farmers, ranchers, and construction workers. Rabbits and Humans Rabbits are often used as a symbol of fertility or rebirth, as in spring, and have long been associated with Easter, as the Easter Bunny. Rabbit is, in many areas of the world, a part of daily life – like food, clothing, a companion, and a source of artistic inspiration. In the Chinese New Year, the zodiacal rabbit is one of the twelve celestial animals in the Chinese zodiac. A rabbit's foot is believed to bring good luck and protection. This belief is found in many parts of the world, with the earliest use being recorded in Europe c. 600 BC. Rabbits with human characteristics have appeared both in film and literature, for example, in Alice's Adventures in Wonderland, Peter Rabbit stories written by Beatrix Potter, and Bugs Bunny cartoons. Coney Island likely got its name from the fact that it used to have a big wild population of rabbits. Rabbit Worksheets This bundle contains 10 ready-to-use Rabbit Worksheets that are perfect for students who want to learn more about Rabbits which are mammals that belong to the Lagomorph order that also includes hares and pikas. Download includes the following worksheets Rabbit Facts Rabbit Monikers The King of Rabbits Rabbit Breeds Long-Haired Bunny Match-up Show Bunny Art Bunny Care Bunny Folklore Rabbit Warren Rabbits are Crepuscular Bunny Bookmark Rabbits are affectionate and social pets. They can be great house pets if you take the time to socialize them and learn about their basic body language. Rabbits do however require a lot more care than people typically expect. Rabbits' teeth have a unique feature that enables them to grow constantly. The top front teeth can grow at a rate of 3mm a week. Rabbits can sometimes eat their own young. This is most likely to happen if a pet is feeling particularly anxious, lacks dietary protein, or has become excessively territorial. Rabbits perform an athletic leap, known as a "binky" when they're happy, performing twists and kicks in mid-air. Rabbits are known for their insatiable reproductive habits. They breed three to four times each year because only about 15 percent of baby rabbits make it to their first birthday.
