Print via wifi from android

How can i print from my android phone via wifi. How to print through wifi from mobile. How to print from android phone to epson printer via wifi. How to print from android phone to canon printer via wifi. How to print from android phone to hp printer via wifi. How to print from android phone via wifi.

Depending on the version of the Android or model operating system, it is possible that the intelligent device can be connected to the printer via Wi-Fi Direct. Even the operating procedure is different. See the documentation supplied with your smart device for operating instructions. If you cannot connect using the following procedure, set the printer to Wi-Fi Direct (simple AP), then try again. Use Epson IPRINT to complete the connection settings. If it is not installed, install it on the Smart device from the following URL or the QR code. You can connect an Android device directly to your product without using a router or wireless access point. To use this function, the Android device must have the following installed: Android 4.4 or later Epson IPRINT Version 7.0 or later If the Smart device does not support the above software, see the link below. Press the Home button if necessary. Press the icon. See a screen like this: select Wi-Fi Direct. Select Start Setup. Select Android. See a screen like this: On your smart device, open the Epson IPRINT app and tap the printer is not selected. Select the printer to which you want to connect. On the product LCD screen, select Approve. At the end, select Complete. You can print your documents in wireless mode, e-mails, photos and web pages directly from your Android phone or tablet (Android v4.4 or later). With some taps, your Android device will find your Epson product near and print. Connect your Epson product to your wireless network. Look at the link below. On your Android device, download the Epson Print Enabler plug-in from Google Play. Go to the settings on your Android device, select Print and enable EPSON plug-in. Connect your Android device to your product's same wireless network. Now you are ready to print. From an Android application like Chrome or Gmail, touch the menu icon and print all that is on the screen. Note: If you don't see the product, tap all printers and select the product. Your new Android tablet is a thin and thin calculator machine, but some of the basic features of a computer is missing, as the possibility of connecting a printer. However, you can access a printer from the Android tablet by installing a printing application. You can choose to install a specified printer app for the printer model, such as the HP ePrint app. You can select an app that will be printed directly on the device via Bluetooth or Wi-Fi, like the PrinterShare app. You can also use an app that connects to the Google cloud printing service, such as Cloud printing. Sorry I don't know the press using Bluetooth devices .. But, I did some research on the press using WiFi and published that Code in Github, you can refer to this if necessary. Android-WiFi-Print - Github This is the flow of that prototype. Check the connectivity. If connected in wifi .. I'm storing the wifi configuration. Now checking if I already have the printer information (the wifi printer wifi configuration) is available or not. If available, scanning and receive list of wifi scansults and connect to this other. Show list of wifi and clicking this, the user will connect to the printer and stores the WiFi configuration for future print jobs. After completing the print job, I am connecting to my previous WiFi or mobile data connection. Now coming back to the 2nd step. If the user is connected to mobile data, I'm just enabling WiFi and after the next step. After completing the print job, I am disabling WiFi. So we'll be to the mobile data connection. (It is Android default). Under class you will take care of all print jobs in that prototype.
